EXPERIMENT: 20 IMPLEMENTATION OF IOT BASED SMART GARDENING

Aim: To implement IOT based smart gardening using Cisco packet tracer.

Software/Apparatus required: Packet Tracer/End devices, Hubs, Connectors.

Procedure:

Step 1: Create a new project in Cisco Packet Tracer and drag a generic IoT device from the IoT devices section onto the workspace.

Step 2: Right-click on the IoT device and select Config/Attributes.

Step 3: In the Configuration tab, select the device's IoT server from the drop-down list. You can choose Cisco IoT Cloud or another cloud service of your choice.

Step 4: In the Attributes tab, add the following attributes:

- Temperature
- Humidity
- Soil Moisture
- Light Intensity

Step 5: Create a soil moisture sensor and a light sensor from the Sensors section of the devices panel.

Drag and drop these sensors onto the workspace.

Step 6: Connect the sensors to the IoT device using the wiring tool.

Step 7: Configure the sensors by right-clicking on them and selecting Config/Attributes. Set the sensor type, unit of measurement, and other necessary parameters.

Step 8: Create a water pump and a light bulb from the Actuators section of the devices panel. Drag and drop these actuators onto the workspace.

Step 9: Connect the actuators to the IoT device using the wiring tool.

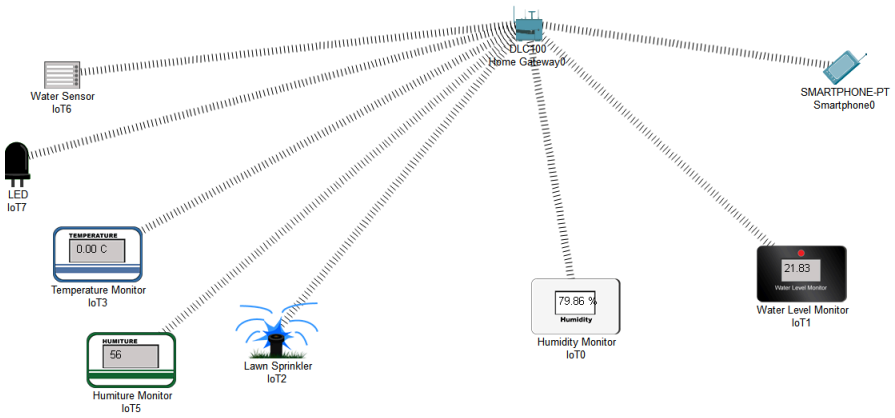
Step 10: Configure the actuators by right-clicking on them and selecting Config/Attributes. Set the actuator type, command, and other necessary parameters.

Step 11: Save the configuration and run the simulation to test your IoT Smart Garden.

Step 12: Monitor the temperature, humidity, soil moisture, and light intensity readings on the IoT device dashboard.

Step 13: Use the dashboard to control the water pump and light bulb based on the sensor readings.

OUTCOME:



Result: Implementation of smart gardening is carried out using IOT successfully.
